

Future Trends in SEPM: Low-Code/No-Code Platforms

The most influential trend shaping software project management in the next 10 years

Lauren Pechey

INTRODUCTION

- ✿ *Low-code/no-code platforms: build software with minimal hand-coding.*
- ✿ *Transforming software development and project management.*
- ✿ *Key claim: Will change how projects are planned, executed, and delivered.*

IT MATTERS

- ✦ *Accelerates project timelines → faster sprints & delivery*
- ✦ *Reduces resource dependency → “citizen developers” can contribute*
- ✦ *Redefines risk management → fewer coding errors, new governance challenges*
- ✦ *Changes cost & effort estimation → new planning models (Rashid et al., 2023)*

LINKS TO RESEARCH

- ✿ *Cabot, 2020: Low-code democratizes model-driven engineering*
- ✿ *Mäkitalo et al., 2020: Promotes opportunistic software reuse*
- ✿ *Rashid et al., 2023: Low-code affects cost & effort estimation trends*

FUTURE IMPLICATIONS

- ✦ *Mixed teams: developers + citizen developers*
- ✦ *Accelerates digital transformation*
- ✦ *Could reduce development cycles by 50–70% → more responsive project management*

CONCLUSION

- ★ *Low-code platforms are the most influential trend in SEPM*
- ★ *Redefines how software projects are managed, resourced, and delivered*
- ★ *“In 10 years, PMs may orchestrate software creation rather than write code.”*
